About Dutch Regulators

Dutch Regulators is a company located in The Netherlands manufacturing stainless steel pressure regulators for gas and liquid applications. The main focus of Dutch Regulators is supplying high quality products, by understanding the needs of the end users.

Dutch Regulators is a company that recently started, but there is more than ten years of experience in designing and manufacturing high quality pressure regulators.

Product range

The product range of Dutch Regulators will be all types of pressure regulators and back-pressure regulators with sizes of a 1/4" up to 3" regulators.

The markets where the products are being used are:

- General industry
- Tankblanketing
- Pharmaceutical

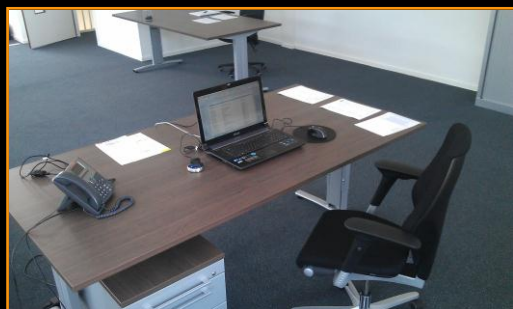

At this moment the parts for the models GRT20 and GBT20 are in stock. Soon there will be more parts in stock so it is possible to have short delivery times for standard models.

Company Building

Recently we entered our brand new company building. This modern building with a nice workshop provides a professional and clean environment for engineering, testing and assembly of the pressure regulators.

The office part is fully operational now and we are building up the workshop at the moment.

The floor level of the office has a nice room to meet with customers and to give product presentations. The first floor of the office gives room for the office staff. The workshop is located behind the office.

Website

Our website www.dutchregulators.com is up and running at this moment and this is the place to find more information about the regulators.

There are a few datasheets available at this moment, but there will be more available as soon as the datasheets are ready.

We would invite you to visit the website and have a detailed look at the regulators of your interest.

The website functions at the moment as our catalogue, but there will come a catalogue when all the datasheets are ready.

Workshop

The main function of the workshop is for testing the pressure regulators. Besides testing it is used for quality control of the incoming parts and used to store the regulator parts.

All the regulator parts are produced by sub-contractors according to the specifications of Dutch Regulators. The sub-contractors are familiar with the production of pressure parts and the parts are checked at Dutch Regulators before being used in a pressure regulator.

At the moment we are building up a testbench to test the regulators with compressed clean air. The air comes from our 300 bar storage and when necessary the air-pressure can be boosted up to 700 bar or higher.

The air storage is large enough for the flowtestbench that needs to be built later.
